
Hollow: the first test. Filled: the pre-registered re-test. The mechanism's boost was small-sample structure; the data road's was not, and survives at a quarter of the size.

Both panels are debug-scale and absolute levels are comparable only arm against arm inside each panel. The merge's own held-out realism AUC reads below the single-domain arm's in the re-test (0.976 against 0.995) where the first test gained 0.012, so every number from the first test should be treated as small-sample in both directions.
