
Read-only tests on a fixed store, one estimator, no training and no new data. The representation is per recording in every row, so same-recording leakage is impossible by construction. The finding that holds in both draws is the one to carry: in Perch's space the recordist lift is still twice the species lift, in BirdNET's 4.5 times, in ours 23 times. Every space tested is confounded in the same direction and they differ only in degree.
