

625 field syllables, three species, identical points, one seed. Hollow marker: the 28-d descriptor. Filled: the 32-d embedding. Clay is the counterweight: render-free placement moves the wrong way, and the recordist confound lives in the embedding, not in the descriptor. Debug-scale.

28-d descriptor, 32-d out: a kernel ridge over random Fourier features ($D = 2048$, $\sigma = 4.4$, $\lambda = 1$), gated on held-out recordings, never on held-out syllables. It ships as plain numbers; no weights reach the browser. The linear map was replaced by measurement, not taste.
