
The funnel is drawn in the three units it actually changes through rather than on one axis. The loss is accounting, not machinery: 6 940 of the collapsing bouts are three syllables or more, a bird repeating one sound, which is a repertoire fact and not a measurement error. Repeat classes - one collapsed string heard at least six times, matched by equality - take song types from 96 to 356 (96 motifs, 260 repeats) and placed bouts from 1 052 to 3 741, with the within-species shuffle control unchanged to the bout at 0.170 % against a 0.2 % bar. Ninety-eight of 2 421 species is 4.0 %. Production store.
